Exp15:Write the python program to implement Decision Tree

```
from sklearn.tree import DecisionTreeClassifier

# Training data
X = [
    [1, 1],
    [1, 0],
    [0, 1],
    [0, 0],
    [1, 1],
    [0, 0]
]

# Output labels
y = ["Yes", "Yes", "Yes", "No", "Yes", "No"]

# Create and train the model
model = DecisionTreeClassifier(random_state=0)
model.fit(X, y)

# Predict a new sample
prediction = model.predict([[1, 0]])

print("Prediction:", prediction[0])
```
